Everllence B&W Tier II and Tier III engine programme

The two-stroke engines in this programme are either:

- Tier II engines complying with IMO Tier II
- Tier III engines complying with IMO Tier II when operated in IMO Tier II mode, and with IMO Tier III when operated in IMO Tier III mode

The latest updates on engine development and options are available at: www.everllence.com → marine → products → planning-tools-and-downloads → market-update-notes.

The latest updated engine programme is available at: www.everllence.com → marine → products → planning-tools-and-downloads → marine-engine-programme.

Engine type designation

To ensure that the engine designation describes the engine with regard to the fuel injection concept and in case of Tier III engines the IMO Tier III technology applied, the engine type designation also includes these concepts as described below (full designation, see page 20).

5G70ME-C10.58-GI-HPSCR

-
- Tier III technology (EGRTC, EcoEGR, EGRBP, HPSCR, LPSCR)
No designation = Tier II
 - Fuel injection concept (GI, LGIM, LGIP, GIE)
No designation = MDO/HFO

Fuel injection concepts are explained in detail on page 10 (ME-GI and ME-LGI dual fuel engines) and IMO Tier III technologies on page 22.

ME-C engines

The electronic control of the ME-C engines includes flexible control of the cylinder processes, i.e. fuel injection timing and actuation of exhaust valves, starting valves, and cylinder lubrication.

CEAS, TCS and Engine selection guide

CEAS (computerized engine application system), TCS (turbocharger selection) and Engine selection guide applications cover all engine variants including available dual fuel and IMO Tier III technology options. These applications provide essential data for the design and dimensioning of a ship's engine room (CEAS), applicable turbochargers (TCS) and Engine selection guide.

CEAS/TCS/Engine selection guide are available online at: www.everllence.com → marine → planning-tools-and-downloads → ceas-engine-calculations/turbocharger-selection/engine-selection-guide

In CEAS and TCS, all engines in this programme can be selected from the category 'Catalogue: Official'. For new ship design projects, it is recommended selecting engines from this official engine catalogue.

Earlier versions of this engine programme mention additional engine types. Some of these are still available in CEAS and TCS under the category 'Catalogue: Replaced'. Engines from the replaced catalogue are available for ordering on equal terms as engines from the official catalogue without any restrictions.

CEAS reports are valid for ordering from our licensed engine builders for up to 12 months after the creation date of the report.

The Engine selection guide is our most recent web tool designed to offer an easy overview of our two-stroke Everllence B&W engine portfolio. With a few inputs, it provides a list of relevant engines and variants and offers the option to sort the engine selection according to fuel consumption.

Engine power

The engine brake power is stated in kW. The power values stated in the tables are available up to tropical conditions at sea level, i.e.:

- turbocharger inlet air temperature 45°C
- turbocharger inlet air pressure 1,000 mbar
- cooling water (sea/fresh) temperature 32/36°C

Engine fuel consumption

Everllence specifies fuel consumption for two-stroke engines in two equivalent ways:

- Specific fuel oil consumption (SFOC) is used for fuel oil engines (non-dual fuel) as well as the fuel oil mode on dual fuel engines. It specifies the weight (gram) of fuel needed to produce one kWh of mechanical energy [g/kWh].
- Heat rate (HR) is used for second fuel mode on dual fuel engines combusting a mix of pilot oil and second fuel (gas/liquid). It specifies the energy in the fuel needed to produce one kWh of mechanical energy [kJ/kWh].

Specific fuel oil consumption (SFOC)

The figures in the two-stroke chapter represent the anticipated values for matching the engine and turbocharger as well as the engine fulfilling the IMO NO_x Tier II or Tier III emission limits.

The SFOC figures are given in g/kWh and are based on the use of a fuel oil with a lower calorific value (LCV) equal to 42,700 kJ/kg at ISO conditions:

- turbocharger inlet air temperature 25°C
- turbocharger inlet air pressure 1,000 mbar
- cooling water temperature 25°C

Tolerances

The energy efficiency design index (EEDI) has led to increased focus on low-load fuel consumption. Therefore, Everllence supports the option to select fuel consumption guarantees at a load point in the range from 50% to 100%.

Tolerances on the fuel consumption values presented are as follows:

- 5% tolerance for 100–85% engine load
- 6% tolerance for 84.99–65% engine load
- 7% tolerance for 64.99–50% engine load

Everllence does not support the selection of guarantee points below 50% engine load. For reference, the tolerance is 8% on fuel consumption figures below 50%.

Fuel consumption and EEDI figures are specified for ISO reference conditions.

Turbocharging system

Two-stroke engines can be delivered with Everllence, Accelleron, or MHI turbochargers as standard.

The SFOC figures given in the two-stroke chapter are based on turbocharging at a level of efficiency generally achievable, which means 67% at 100% engine load at SMCR for all engines.

There are exceptions to this rule, S40ME-C9.5 and S35ME-C9.7 are also available as conventional efficiency (64%) applications for both IMO Tier II and IMO Tier III options.

Only engine specifications for which an applicable high-efficiency turbocharger is available are subject to firm order.

Economiser possibilities for engines in Tier II mode

If a higher steam production is needed, the EEC (economiser energy control) solution offers additional automatic control of an exhaust gas boiler (EGB). Forcing an EGB open at loads where the EGB is normally closed results in a higher exhaust gas temperature, but with a negative impact on SFOC. However, the total fuel consumption (engine and oil-fired boiler) can be improved. Calculations with EEC are made on request.

ME-GI and ME-LGI dual fuel engines

This engine programme includes various engines designed for gas fuel (ME-GI) and liquid gas fuel (ME-LGI engines) operation.

Fuel types

Fuel	Fuel designation	LCV [kJ/kg]
Methane (LNG)	GI	50,000
Methanol	LGIM	19,900
Ammonia	LGIA	18,600
LPG*	LGIP	46,000
Ethane (LEG)	GIE	47,500

*LPG is a mixture of liquid propane and butane.

In this engine programme, engines available for different fuel types are listed in separate sections: GI (page 35), LGIM (page 59), LGIA (page 51), LGIP (page 69), and GIE (page 73). In addition to the mentioned ME-LGIA engine variants also G80ME-C10.7 is available on request at MarineProjectEngineering2S@everllence.com.

Pilot oil energy fraction

In dual-fuel mode, the pilot oil energy fraction amounts to 1.5% or 5.0% for GI, depending on engine type, and 5.0% for LGIM, LGIA, LGIP and GIE. The listed pilot oil energy fractions refer to L1-rated engines operating at 100% load point in IMO Tier II mode. Actual values vary depending on engine rating and load conditions. For actual pilot oil energy fractions, refer to CEAS.

Fuel designation	Available pilot oil fraction [%]	Compatible pilot fuel oil types
GI	1.5/5.0	MDO & fuel oil ($\leq 0.50\%$ S)
LGIM	5.0	MDO & fuel oil ($\leq 0.50\%$ S)
LGIA	5.0	MDO & fuel oil ($\leq 0.50\%$ S)
LGIP	5.0	MDO & fuel oil ($\leq 0.50\%$ S)
GIE	5.0	MDO & fuel oil ($\leq 0.50\%$ S)

The following fuel consumption figures are shown in the tables for dual fuel engines:

- dual fuel mode with distribution of specific gas consumption (SGC) and specific pilot oil consumption (SPOC)
- fuel oil mode (SFOC)

Heat rate is defined as follows (example for methane as dual fuel):
Heat rate (kJ/kWh) = SGC (g/kWh) × 50 kJ/g + SPOC (g/kWh) × 42.7 kJ/g.

The CEAS report specifies the distribution between SGC and SPOC as well as the heat rate over the load range. The SPOC figures have a tolerance specified as:

- 50% tolerance for 100–65% engine load
- 75% tolerance below 65% engine load

Greenhouse gas emissions

In existing IMO regulations, the energy efficiency design index (EEDI) and the carbon intensity indicator (CII) operate with CO₂ as the only contributor to greenhouse gas (GHG) emissions in a tank-to-wake-perspective. However, IMO is discussing new rules to limit the GHG intensity of fuels in a well-to-wake perspective. These rules would also include methane and nitrous oxide (laughing gas), and not just CO₂.

While IMO negotiations are ongoing, FuelEU Maritime and the EU emissions trading system (ETS) already cover methane slip and laughing gas in a well-to-wake and tank-to-wake perspective, respectively.

Everlence is prepared for these developments and lists the industry-leading, very low (near negligible) methane slip levels for ME-GI engines in the CEAS report.

Tier III technologies

To address compliance with IMO Tier III regulations, an IMO Tier III NO_x reduction technology must be selected. The preferred technology depends on market demands, engine type, other requirements, and operational pattern.

The Emission Project Guide provides more detailed descriptions of these technologies at: www.everllence.com → marine → products → planning-tools-and-downloads → project-guides → two-stroke.

All IMO Tier III engines have at least two operating modes:

- IMO Tier III mode fulfilling the IMO Tier III regulations
- IMO Tier II mode fulfilling the IMO Tier II regulations

For dual-fuel engines there is an IMO Tier II and an IMO Tier III mode for both fuel oil and second fuel – total 4 modes.

Tier III technologies are designed for either low-sulphur fuels ($\leq 0.10\%$) or high-sulphur fuels ($> 0.50\%$ and $\leq 3.50\%$) in Tier III operation. In Tier II operation, the engine is in all cases, except EcoEGR, capable of operating on fuels with a high sulphur content. The fuel sulphur content must be selected when the engine is ordered, as it impacts the engine design.

EGR

The following EGR-matching concepts are available depending on engine bore:

- EGRTC: T/C cut-out matching for ME-C engines with bores ≥ 80 cm
- EGRBP: Bypass matching for some ME-C engines with bores ≤ 70 cm

EcoEGR

EcoEGR is a fuel consumption-optimised version of the EGR engines. Compared to the standard EGR system, EcoEGR engines operate with 10–15% recirculation in Tier II mode and with slightly increased recirculation in Tier III mode. EcoEGR engines can achieve considerable fuel savings when operating on compliant fuels ($\leq 0.50\%$ S).

Low Sulphur EGR & EcoEGR – Max sulphur content:

- Tier II: 0.5%
- Tier III: 0.1%

SCR

Two SCR concepts are available:

- HPSCR: high-pressure SCR with a reactor installed upstream the turbocharger(s)
- LPSCR: low-pressure SCR with a reactor installed downstream the turbocharger(s) is available on a limited set of engine variants

The SCR system must be supplied by an approved supplier.

Fuels

Since 1 January 2020, the global sulphur content for marine fuels must not exceed 0.50%. To ensure compliant operation, one of the following methods must be selected:

- Use a compliant fuel:
 - Global: max. $\leq 0.50\%$ sulphur
 - ECA: max. $\leq 0.10\%$ sulphur
- Use methane, ethane, methanol, or LPG together with a compliant pilot fuel.
- Use a high-sulphur fuel in combination with a SO_x scrubber to obtain an exhaust gas SO_x level equivalent to operation on a compliant fuel.

The fuel specification must be selected at engine order as it impacts the engine design.

Fuel oil with a viscosity below 700 cSt at 50°C can be used.

Application of high-sulphur fuels and SO_x scrubbers

All two-stroke engines in the Everllence marine engine programme are compatible with SO_x scrubbers. A CEAS report with a scrubber solution for dual-fuel engines is available on request at MarineProjectEngineering2S@everllence.com.

Waste heat recovery systems

Waste heat recovery systems (WHRS) are available for certain engine configurations on request for both IMO Tier II and IMO Tier III engines with high-efficiency turbochargers. Further information is available on request at MarineProjectEngineering2S@everllence.com.

Power take off systems

Everllence supports the integration of power take-off (PTO) systems for both IMO Tier II and IMO Tier III engines with high-efficiency turbochargers. PTO systems operate in the margin between the light propeller curve and the load limits of the engine. The magnitude of PTO power permitted is as such influenced by the propeller light running margin applied for the specific project. The specific load of the engine permitted for design, including power for propulsion and PTO power, as a function of speed, is governed by the PTO layout limit.

For further information on the PTO layout limit as well as the availability and integration of PTOs, please contact Everllence. Information about the different PTO solutions can be found in the paper "Shaft generators for low speed main engines" – available at: www.everllence.com → marine → products → planning-tools-and-downloads → technical-papers.

Lubricating oil consumption

The system oil consumption varies according to engine sizes and, operational and maintenance patterns.

Specific cylinder oil consumption

Alpha ACC (Adaptive Cylinder oil Control) is the lubricating mode for Everllence B&W two-stroke engines that involves lube oil dosing proportional to the engine load and to the sulphur content in the fuel being burned.

Dosage:

- 0-0.50% sulphur fuels including methane (LNG), methanol, LPG and ethane (LEG):

Minimum feed rate: 0.6 g/kWh

- >0.50% sulphur fuels (HSFO) (scrubber applications): Feed rate (g/kWh) = $ACC \times S\%$,
 - where typically $ACC = 0.3 \text{ g/kWh} \times S\%$

Recommended cylinder oils:

- Cat. II BN 40 cylinder oil is recommended for engines using low-sulphur fuels:
0-0.50% sulphur fuels including methane, methanol, LPG and ethane
- Cat. II BN 100-140+ cylinder oil is recommended for engines using high-sulphur fuels:
>0.50% sulphur fuels

In the past, cylinder lubricating oils have been mixed to optimise the cleaning performance of an oil to the level required by a specific engine, or specific operating conditions. For example, by mixing a Cat. II BN 100 oil with a less efficient BN 40-70 oil. With the introduction of Cat. II BN 40 oils, alternating between high- and low-BN cylinder oils is no longer necessary.

For specific lubrication guidelines, reference is made to the latest lubrication guidelines available for your specific engine type, for example Service Letters. Service Letters are available at:

www.everllence.com → marine → planning-tools-and-downloads → Service Letters.

Extent of delivery

In principle, any binding extent of delivery of Everllence B&W two-stroke engines is to be supplied by our licensee, the engine maker, who should be contacted to determine the execution for the actual project.

Special certification processes will need to be specified before an order is placed if they require a different scope of delivery, for example: engines certified for US EPA.

Engine functionality options

Everllence Asset+ and **Engineering+** engine functionality options enable installation and management of optional updates and features for Everllence B&W engines. It is a range of flexible solutions that can match the individual needs of the end users. Their application depends on the engine and ship type, and they can be ordered directly from our licensees.

Everllence Asset+

Asset+ features consist of the following software and digital solutions:

PMI ACCo

PMI Adaptive Cylinder Control (ACCo) is a fully automatic system that ensures constant optimal engine tuning regardless of engine load, load changes, and varying fuel calorific values. Using performance values from the engine's official shop test as reference, the algorithm adjusts the fuel index and exhaust valve operation of each cylinder. PMI ACCo aims for the lowest possible fuel consumption.

PMI ACCo is the standard configuration for ME-C10.7 and dual fuel engines.

Synchrophasing

Synchrophasing is an effective, maintenance-free tool introduced for ship types with twin propulsion to reduce vibrations on both vessel and engine structures. Vibrations are reduced by synchronising the port and starboard shaft speeds, thereby out-balancing forces/ moments from the starboard engine/propeller with the same forces/ moments from the portside engine/ propeller.

Vibrations can be reduced by up to 50-70% depending on sea wave state and vessel roll/pitch. Synchrophasing is available on request for all ME-C engines.

PTO interface option C

PTO interface option C is an enhanced interface between the engine control system (ECS) and the vessel's power management system (PMS) for plants with a large power take-off (PTO) or shaft generator capacity relative to the SMCR-power.

The enhanced interface improves governor stability and performance, and increases PTO power availability in the design. In addition, PTO interface option C provides signals to the PMS that enable automatic load sharing between the main engine, the PTO, and the gensets. This ensures a higher utilisation rate of the PTO, thus reducing the genset's running hours. If power is supplied solely by the PTO, it will also reduce the risk of blackout without overloading of the engine.

PTO interface option C is available on request for all ME-C engines equipped with a large PTO.

PTO PowerMax

PTO PowerMax for EEDI adds additional benefits for engines using PTO interface option C. By applying the EEDI guideline's option 2 for accounting for the PTO, the EEDI can be improved, especially, but not exclusively, for vessels with a large onboard electric power consumption. At the same time, it ensures installation of a main engine with sufficient power and, hereby, torque capacity for driving the PTO in conditions less ideal than at sea trial.

AutoTorque

A new governor control mode in the main engine control system aiming to keep the fuel injection stable in dynamic sea conditions. By maintaining a stable fuel injection and allowing the propeller to vary from the speed setpoint to a slightly higher speed, AutoTorque offers a smoother governor control, providing higher fuel efficiency when operating under the influence of waves.

AutoTorque is available for all ME-C Tier III engines. It will be part of the standard configuration for engines of bore sizes 80 and above, and built on design specifications ordered after 1 September 2025. For smaller-bore engine sizes, AutoTorque can be added upon request.

Everllence Engineering+

Everllence Engineering+ solutions are unique engineering designs as described in the following:

Adaptive Cooling

Adaptive Cooling is an improved design of the piping and valve arrangement for automatic control of the cooling water flow to the scavenge air cooler and the exhaust gas recirculation cooler for EGR engines, depending on the engine operating mode.

It reduces the power consumption for cooling water circulation significantly when running in IMO Tier II mode (EGRBP engines) or TC cut-out mode (EGRTC engines), see page 12, and, as a result, typically reduces fuel consumption and improves the CII rating.

Adaptive Cooling is available on request for all EGRBP and EGRTC engines.

Two-stage Cooler

The Two-stage Cooler is a new scavenge air cooler design that uniquely enables utilisation of the energy from the scavenge air cooling process for other energy-consuming processes on board, such as increasing the boiler feedwater temperature, gas vaporisation, freshwater production, air condition heating, organic Rankine cycle system, or the ballast water treatment system. This typically leads to lower fuel consumption and improved CII rating.

The Two-stage Cooler is available on request for all Everllence B&W two-stroke engines, based on a case-specific pre-study conducted by Everllence.

Gas Return System

The gas return system is an innovative solution that captures gas emitted during blowdown events when the main engine gas operation is stopped. This prevents unnecessary emissions and repurposes the gas for onboard energy consumption.

The system typically enhances energy efficiency, reduces methane emissions and fuel consumption, and improves CII rating.

It is available for all newbuild Everllence B&W dual-fuel ME-GI engines.

Engine dimensions

The minimum length of engine (L_{min}) is stated from the aft end of the crankshaft to the fore end of the engine.

L_{min} Minimum length of engine

A Cylinder distance

B Bedplate width

B1 Bedplate width at foot flange

B2 Bedplate width at top flange

C Crankshaft to underside of foot flange

H1 Normal height lifting procedure

H2 Reduced height lifting procedure

H3 Reduced height lifting procedure with double-jib crane

H4 Normal height lifting procedure with double-jib crane

Dry masses

Dry masses are stated in metric tonnes for engines with Everllence turbocharger(s) and a standard turning wheel. Figures will vary depending on the design and options chosen, for example, moment compensators, turning wheel, etc.

Dry masses for IMO Tier III engines cover components directly integrated on the engine.

Indicated values are for guidance only and are not binding.

Everllence

A new chapter

Everllence B&W ME-LGIA

Powering the future with our Everllence B&W ME-LGIA

When generated from renewable energy sources, ammonia has virtually no carbon footprint.

As newbuild or retrofit, ME-LGIA offers a prominent pathway towards maritime decarbonization. Maritime transport is about to start a new, cleaner chapter with this valuable addition to our two-stroke dual-fuel engine portfolio.

Forever forward. Forever decarbonization. Forever excellence.

We move big things to zero with future-proof retrofit solutions.

Retrofit solutions are among the most effective ways to achieve net-zero targets. Our experts convert your conventional fuel engines into dual fuel systems that can also run on green e-fuels. By upgrading existing engines and turbomachinery, we balance ecology and economy, and give your business a long, clean future.

everllence.com

Only one thing has changed.
MAN Energy Solutions is now:

Everllence

Navigate the future of shipping

Leading the way in sustainable two-stroke propulsion

The unrivaled flexibility of Everllence B&W two-stroke engines is the key to future-proof propulsion. Our proven dual-fuel engines operate on a broad variety of alternative fuels including methanol, methane, LPG, ethane and soon ammonia. Our retrofit capabilities let you adapt your current assets and give you even more flexibility. Future-proof your fleet with Everllence B&W newbuilds and retrofits.

Forever power. Forever decarbonization. Forever excellence.

We move big things to zero with future-fuel engines.

Global shipping is advancing towards sustainability, and we're developing engines powered by climate-neutral fuels such as green methanol, hydrogen, and synthetic natural gas (SNG). Following our world-first methanol dual fuel engine, we introduced the first ammonia engine in our portfolio. Working with the marine industry, we can move ships with zero emissions.

PrimeServ Omnicare

Everllence Moving big things to zero

Your one-stop service solution

Welcome to PrimeServ Omnicare – a one-stop service solution that provides complete support for all your equipment, regardless of the manufacturer.

This means global and local expertise from the industry's most trusted specialist, whenever and wherever you need it.

PrimeServ Omnicare brings simplicity and cost-efficiency to your fleet, minimizing unplanned downtime, reducing costs, and extending the lifetime of your assets.

Everllence two-stroke propulsion systems

Alpha propeller and aft ship solutions

Propeller Programme – CPP and FPP

Alpha CPP (controllable pitch propeller):

- As standard Mk 5 propeller versions are 4-bladed
 - optional 3- and 5-bladed propellers are available on request
 - optional full-feathering capability for all hub sizes and blade numbers
- Standard power range is up to 40 MW per shaft
- The figures stated after VBS (in the following tables) indicate the propeller hub diameter
- Standard blade/hub materials are Ni-Al-bronze, stainless steel is optional
- The propellers are available up to the highest ice classes, however, the standard programme is based on 'no ice'

The Alpha FPP (fixed pitch propeller) portfolio includes:

- Power range of 4-50 MW per shaft
- Blade configurations for 3-, 4-, 5-, and 6-bladed propellers
- Monoblock propellers or as built-up for special applications
- Propellers with integrated shaftline and stern tube solutions

The following benefits characterise our propeller solutions:

- High-efficient, hydrodynamically optimised blade profiles – Kappel designs available
- High reliability – robust approach with ample mechanical design margins
- High-efficient aft ship integration with rudder, rudder bulb, ducts and other efficiency devices.
- Layouts for complete propulsion and propeller shaft systems
- A wide range of stern tube lube and sealing systems are offered for oil, water and biodegradable oils.
- Plant calculations with upfront consideration of torsional vibrations (TVC), ice impact simulations, whirling, etc.
- Our Alphasonic 3000 Propulsion Control System ensures optimised and safe operation

Alpha propeller and aft ship solutions

Two-stroke propulsion system installation

Complete powertrain with propeller and aft ship equipment.

The hydrodynamic edge

In the complex hydrodynamic entity embracing hull, propeller, and rudder – our CFD-based software masters the holistic approach of customised blade and rudder bulb designs.

We perform 'Resistance calculations' and 'Calculations of wake field', which form the basis for the following:

- Final propeller design
- Self-propulsion calculations
- Cavitation extent calculations
- Propeller-induced pressure impulses and CIS (cavitation inception speed)

Save the 'stock propeller test'; save time and save money.

With EcoBulb rudder bulb and propeller hub fairing cone installed, uniform flow without separation creates improved thrust ahead, and less power is required.

CFD model with streamlines and surface pressure distribution.

Everlence B&W standard package examples

Cyl.	kW	Prop. speed r/min	D ¹⁾ mm	Hub VBS mm	Q mm	R mm	Wmin mm	Prop. mass t ²⁾

Alphatronic 3000 Propulsion control system

A high number of various FPP and CPP propulsion package applications are controlled by the Alphatronic 3000 system – customised for combinations of Everlence low and medium speed engines in a wide range of diesel-mechanical, hybrid or diesel-electric propulsion setups.

Alphatronic propulsion control system

Everllence four-stroke propulsion engines

Everllence four-stroke propulsion engines – all emission requirements

Besides focus on power density and fuel economy, Everllence is committed to a steady reduction of the environmental impact of our engines.

IMO Tier II

Everllence has decreased NO_x emissions significantly by applying well-proven methods that ensure a cleaner and more efficient combustion process. Our four-stroke propulsion engines are IMO Tier II compliant by internal engine measures alone.

IMO Tier III

For operation in emission control areas (ECA), Everllence has developed a comprehensive range of selective catalytic reduction (SCR) systems that provides a tremendous reduction in NO_x levels surpassing IMO Tier III requirements.

The Everllence standard SCR system is available in fourteen different sizes covering our entire portfolio of four-stroke engines. Customised SCR systems are offered on demand.

Everllence has developed a complete range of SCR systems that work perfectly with our engines for maximum system efficiency. The intelligent exhaust gas temperature control allows significant savings in fuel consumptions as compared to third-party supplier systems.

Everllence SCR systems can be used for distillate fuel and residual fuel up to 3.5% sulphur, according to ISO 8217:2024 and in line with the specifications of Everllence.

Urea consumption

The urea consumption depends on engine type, selected performance characteristics (engine map), in case of an engine with ECOMAP capability, operating profile, fuel type, ambient conditions, type of reduction agent, etc.

For more detailed information on the expected level of urea consumption, please contact Everllence with your project specific request.

Everllence SCR system

The modular SCR component kit

Conventional injection engines

Our well-established engine types are used in a vast array of applications all over the world. Based on long-term experience of historical proportions, our engines are in continuous development to increase power, reduce emissions, increase reliability, reduce fuel oil consumption, and increase longevity. Our engines are the prime movers of choice in the maritime sector.

Common rail (CR) engines

The flexibility of our CR technology enables a substantial improvement of the combustion process that improves the fuel economy and reduces emission levels. It is particularly advantageous in the low-load and mid-load ranges where our unique ECOMAP system (optional) applies different engine maps to reduce fuel consumption while observing IMO emission limits. Another feature is our patented Boost Injection. Our engine control system senses a load increase at a very early stage and tremendously improves the load response with the activation of boost injection by the common rail control. In addition, exhaust gas opacity is markedly reduced, far below the visibility limit. Our CR engines run efficiently on liquid fuels complying with ISO 8217 DMA, DMZ, and DMB, and on residual fuels (HFO) up to 700 cSt (in compliance with ISO-F-RMK 700).

Diesel oil (D) engines

The V28/33D STC features very favourable ratios of power-to-weight and power-to-installation space. The combination of low fuel consumption, low emissions and reduced life cycle costs makes this engine the ideal solution for propulsion in high speed ferries, naval and off-shore patrol vessels. The V28/33D STC engine operates on distillates according to ISO 8217 DMA or equivalent fuel types.

With the 175D, Everllence is presenting a new power pack setting future standards in the high-speed diesel engine market. The 175D, developed especially for use in the shipping industry, is part of a product initiative aimed at providing Everllence customers with a product portfolio that covers every power requirement, from high-speed diesel engines to low-speed diesel engines.

Sequential turbocharging (STC)

The Everllence sequential turbocharging system operates with two high-efficiency turbochargers. Depending on the amount of charge air required, the second turbocharger is switched on or off. In this way, the engine is operated at its optimum operating point over the whole applicable load range.

The result is an extended operating envelope at low engine speeds, which gives a power reserve for ship acceleration, ship turning, sprints or towing. Furthermore, the STC system is characterised by a low thermal signature, decreased smoke emission, low vibrations and continuous low-load operation with reduced fuel consumption, which makes it the ideal solution for propulsion in naval applications and offshore patrol vessels.

Dual fuel (DF) engines for natural gas operation

Dual fuel engines for natural gas operation from Everllence run efficiently on liquid fuels or natural gas with very low emissions that are compliant with IMO limits.

On gaseous fuel, the engines comply with IMO Tier III without the need for additional exhaust gas aftertreatment, and on liquid fuel they either fulfill IMO Tier II, or IMO Tier III together with an SCR system. The possibility to switch over seamlessly from gas to diesel operation and vice versa provides full flexibility in multiple applications.

All dual fuel engines for natural gas operation can run on natural gas with a methane number higher than 80 without adjustments. For lower methane numbers, Everllence can deliver well-adapted solutions. The optimised combustion chamber ensures very low fuel consumption in both operational modes.

Methane emissions

CH₄ has a notably higher impact on the climate than CO₂, and the emission of unburnt CH₄ fuel not only reduces the overall operation efficiency, but also affects the environmental footprint of ship operation.

Modern low-pressure dual fuel four-stroke engines provide extensive means of controlling the combustion process. Due to the operating principle, CH₄ emissions cannot be avoided completely. However, based on extensive expertise and experience, the latest Everllence four-stroke dual fuel engines are designed to achieve the best possible results, for example:

- Halving of the CH₄ slip
- The newest developments have halved the values once more
- Further development is successfully ongoing to reach yet another 50% reduction
- Using smart vessel operation optimisation, effective emissions can be additionally reduced already today.

Synthetic fuel operation (optional)

The production of synthetic fuels differs, such as HVO, BTL, CTL, and GTL, according to DIN EN 15940, but the fuel properties are identical and need to comply with the requirements of Everllence.

For the intended use of these synthetic diesel fuels:

- Special considerations for fuel handling, storage, and fuel preparation have to be considered
- To be clarified, whether special equipment is needed on the engine or within the plant
- Change of engine performance to be clarified

If this option is needed, contact Everllence.

Operation on FAME – transesterified biofuel (optional)

For the intended use of FAME fuels, according to EN-14214 or ASTM D6751 and the additional requirements of Everllence:

ISO has published a new version of the ISO 8217 Specifications of marine fuels standard and to support this transition it now allows the use of FAME up to a concentration of 100% in specific grades.

FAME has been used in road transportation for many years and vast experience is available.

However, its adoption within the maritime industry requires specific attention to be given to the handling of these products.

If this option is needed, contact Everllence.

Methanol

Everllence is developing methanol technology paths for various engine types. Green methanol is an important fuel option to decarbonise the operation of propulsion and auxiliary GenSet equipment. Ensuring the feasibility of later retrofits can be crucial to avoid the risk of stranded assets by enabling the concurrent adaption of ships to expected regulations and fuel supply.

Products marked with **Methanol ready*** are intended to be available in future to be sold as methanol capable or will be intended to be available for retrofit to methanol operation under specific boundary conditions.

Please contact Everllence for further details on the engines marked as methanol ready, the certifying class societies, and the currently expected availability of methanol ready for the individual marked engines.

ECOLOAD advisory system

ECOLOAD is an advisory tool for marine powertrains (diesel-mechanic and diesel-electric) installed on-board the vessel on its own dedicated server hardware. Taking into account the current operating condition of the propulsion plant as well as input values entered by the operator, ECOLOAD calculates the optimum operating condition for the entire powertrain, and displays it via a graphical unit interface.

On multi-engine plants, the holistically-optimised operation of the engines becomes very complex. In particular, engines with ECOMAP capability have a huge potential for lowering fuel oil consumption and emissions.

ECOLOAD advisory system providing advice on holistic powertrain operation

Everllence fuel gas supply solutions

Everllence is a world leader in engineering solutions for safe storage of energy on board ships, and reliably providing gas to both engines and fuel cells.

After 20 years of pioneering the market for LNG-fuelled ships, with more than 60 reference projects, Everllence has entered ground-breaking territory, developing unique solutions for storage and regasification of liquid hydrogen. With this milestone, Everllence consolidates its position as your reliable engineering partner for marine applications, as well as breaking new ground with its green power-to-X solutions for onshore applications.

Dual fuel propulsion package including fuel gas storage and supply system

Engine power

Engine brake power is stated in kW.

Ratings are given according to ISO 3046-1.

According to ISO 15550, the power figures in the tables are valid within a range of $\pm 3\%$ up to tropical conditions at sea level, i.e.:

- compressor inlet temperature 45°C
- compressor inlet pressure 1,000 mbar
- seawater temperature 32°C

For all commercial medium speed propulsion engines, the power is defined according to the ICN¹ definition (ISO 3046-1:2002: ISO standard power).

For all navy medium speed propulsion applications, the engine rated power is stated as ICFN (ISO standard Continuous Fuel stop Net power), derived from standard ISO 3046-1:2002. It means the engine is capable to deliver power continuously during a period of time corresponding to the application. The engine is operated at stated speed and reference ambient conditions as stated above, while the fuel amount is limited and the fuel stop power cannot be exceeded. The engine rated power is delivered between the maintenance intervals as defined. The ICFN_i engine power rating description corresponds to 100% engine power output and cannot be exceeded.

Exemplary load profile type

¹ I = Power ISO 3046. C = continuous power output. F = fuel stop power. N = net

Specific fuel oil consumption (SFOC) and specific energy consumption

The stated consumption figures refer to the following reference conditions according to ISO 3046-1:

- ambient air pressure: 1,000 mbar
- ambient air temperature: 25°C (77 °F)
- charge air temperature: according to engine type, corresponding to 25°C cooling water temperature before CAC

The figures are given with a tolerance of +5% and without engine driven pumps. Additional fuel oil consumption must be considered for attached pumps and for engines directly driving dredge pumps.

In accordance with the NO_x Technical Code 2008 of the International Maritime Organization, DM-grade fuel oil is used as reference fuel oil for engine tests and, thus, also forms the basis for the SFOC figures stated for engines in liquid fuel operation.

Unless otherwise specifically stated, SFOC figures are based on a lower calorific value of the fuel oil of 42,700 kJ/kg and, in addition for engines with common rail injection (CR-engines), on DMA-grade fuel oil (ISO 8217). For engines with conventional fuel injection, SFOC figures are based on DMB-grade fuel oil (ISO 8217). For further details, please refer to our engine specific project guides available from Everllence.

Stated SFOC/SGC values are valid for currently applicable rules acc. IMO MARPOL ANNEX VI/NTC 2008, 2023 Edition. They are subject to change regarding draft amendments introduced at MEPC 83 (April 2025) with an entry-into-force date as of that of the revised MARPOL Annex VI, which is expected to be adopted in autumn 2026. There will be a transition phase for new and existing engine groups/families between 2028 and 2030, exact dates to be confirmed.

Specific lube oil consumption (SLOC)

The specific lube oil consumption is specified at MCR (maximum continuous rating) with a tolerance of 20%.

Blocking of output

Blocking of output is made for engines driving a propeller at 100% of the rated output. For engines powering an alternator, blocking of output is made at 110%. However, operation above 100% load is only recommended for a short period of time for recovery and prevention of a frequency drop.

Weights and dimensions

For marine main engines, the weights stated refer to engines without a flywheel.

All weights given are without lube oil and cooling water.

For auxiliary engines (GenSets), weights refer to the unit (including alternator). The weight of the GenSet may vary depending on the alternator make.

The length of the GenSet unit depends on the alternator make. For a twin engine installation, the centreline distance is stated for each engine type.

The centreline distance for a twin engine installation is given as a minimum value. Specific requirements to the passageway (e.g. of classification societies or flag state authority), seating type or a gallery can lead to higher values.

Engine type designation

12V28/33D STC

Everllence

Dual-Fuel, Electric+

**Advanced propulsion
for maximum efficiency**

The new Dual-Fuel, Electric+ (DFE+) propulsion concept for LNG carriers brings together the Everllence 49/60DF engine and ABB's Dynamic AC power distribution and control system. This innovative solution enables variable speed operation, significantly reducing methane emissions. By requiring less machinery space, the DFE+ concept increases cargo capacity and enhances overall energy efficiency.

Everllence

Set your course to net zero with

methanol

Reduce your carbon footprint with methanol GenSets

The L21/31DF-M was the first small-bore dual-fuel methanol GenSet in our portfolio. And the L27/38DF-M is the next milestone and addition to our small-bore engine portfolio. Both engine types can either be used as GenSet or for diesel-electric propulsion.

The foundations of these engines are the trusted and proven L21/31 and L27/38 GenSets, which have jointly accumulated millions of operating hours, with thousands of engines in service.

Everllence four-stroke marine GenSets

Everllence four-stroke marine GenSets – all emission requirements

Besides focus on power density and fuel economy, Everllence is committed to a steady reduction of the environmental impact of our engines.

IMO Tier II

Everllence has decreased NO_x emissions significantly by applying well-proven methods that ensure a cleaner and more efficient combustion process. Our four-stroke propulsion engines are IMO Tier II compliant by internal engine measures alone.

IMO Tier III

For operation in emission control areas (ECA), Everllence has developed a comprehensive range of selective catalytic reduction (SCR) systems that provides a tremendous reduction in NO_x levels surpassing IMO Tier III requirements.

The Everllence standard SCR system is available in fourteen different sizes covering our entire portfolio of four-stroke engines. Customised SCR systems are offered on demand.

Everllence has developed a complete range of SCR systems that works perfectly with our engines for maximum system efficiency. The intelligent exhaust gas temperature control enables significant savings in fuel consumption as compared to third party supplier systems.

Pump on alternator – common base frame

PTO on front end – external pump

Pump on front end – common base frame

PTO on front end – external pump

Fuel oil saving for small bore GenSet (part load optimised)

GenSets can be delivered with improved fuel oil consumption at low load and part load. The penalty will be higher SFOC at high load. The part-load optimised engine complies with the IMO Tier II limit.

The new tuning method, referred to as part-load optimisation, optimises the engine performance at approx. 60-65% MCR, as this is often the load range in which the GenSet is operating, but it can also be customised to other specific operating conditions.

With the new development of L21/31 Mk 2 together with part-load optimisation techniques, fuel oil savings of up to nearly 12 g/kWh have been obtained, depending on the engine type/model and load point.

Traditionally, GenSets are optimised at 80-85% MCR due to limitations in turbocharger matching, but this is also the load point where power management will engage additional GenSets when more power is needed.

With part-load optimisation, there is a fuel oil penalty when the load exceeds approx. 80% MCR, but this has no practical consequence as the GenSet rarely exceeds 85% MCR.

This is illustrated in the figure below. For further information, please contact Everllence.

Based on Project Guide figures for IMO Tier II engines – 60Hz: ISO reference condition, HFO/MDO, without pumps, tolerance +5% (not included) August 2020.

Electric and hybrid propulsion trains (HyProp ECO)

Everllence offers a full range of electric and hybrid power and propulsion plants. Our solutions are designed and optimised to meet the highest efficiencies of an integrated system covering the complete operational profile of the vessel. Our propulsion systems provide a well-balanced and tailor-made solution with emphasis on increased fuel efficiency, flexibility and performance.

Our comprehensive propulsion packages include the complete array of required components from GenSets to propulsors, including switchboards, variable speed drives, propulsion motors and controls. They ensure the optimal technical and economical solution while minimising operational costs.

The HyProp ECO introduces a system to control the power delivered by or to the shaft machine. It overcomes the constraint on constant speed propulsion machinery by utilising variable speed drives at the shaft generator/motor.

Our innovative HyProp Battery system also integrates batteries, which enable an optimised loading of our engines, and provide an electric spinning reserve, dynamic support of the propellers as well as peak shaving.

Hybrid
propulsion
system

Energy-saving electric propulsion (EPROX-DC)

Recent developments in electric propulsion have resulted in electric systems where engines can operate at variable speed. The “classic” constant speed operation of GenSets is no longer a constraint. Utilising an enlarged engine operation map with a speed range of 60% to 100% paves the way to a high potential in fuel oil savings. Each speed set point of the engines can be adjusted independently in order to achieve a minimum fuel oil consumption according to the system load. The electric system using DC distribution enables a decoupled operation of the engines, propulsion drives, and other consumers.

Another major advantage is the possible integration of energy storage systems, like batteries. They can reduce the transient loads on the engines and improve the dynamic response of the propulsion system. Fast load application is removed from the engines and load peaks are shaved. Also, emission free propulsion can be realised when running on the batteries. In addition, the energy storage system allows a constant and high loading of the engines, provides spinning reserve and will have a positive effect on engine maintenance.

Everllence offers this advanced package solution in close cooperation with our partner Aspin Kemp & Associates.

L23/30H monocoque GenSet – continued development

The monocoque GenSet includes several updates of the tried and tested L23/30H engine, which are focused on weight reduction, vibration optimisation and simplified installation.

The most significant update is that the alternator is now a load-bearing component, with a 'top brace' connection to the engine. This enables up to 63% weight reduction of the base frame, which again results in weight reduction of up to 13% of the GenSet and a lower vibration level.

The three and four point 'deck-level' supports significantly simplify the GenSet installation process. This design is installed on a flat deck, which is a major reduction of the vessels foundation structure. Furthermore, applying only three conicals makes the GenSets self-leveling.

The monocoque GenSet application is available for all variants of the L23/30H engine.

Monocoque GenSet

Marine fuels after 2020 (in accordance with ISO 8217)

From 1 January 2020, the global 0.5% limit for sulphur content in marine fuels enters into force. To ensure compliant operation, one of following methods must be used:

- HFO GenSet running on a compliant low-sulphur fuel oil (LSFO) in accordance with ISO 8217.
- Global: max. 0.5% sulphur (VLSFO).
- ECA: max. 0.1% sulphur (ULSFO).
- HFO GenSet running on a high-sulphur fuel oil (HSFO) in accordance with ISO 8217 and with a SO_x scrubber for exhaust gas cleaning.
- DF GenSet running on LNG with a compliant pilot distillate fuel.

Everllence GenSets have for decades been running on low-sulphur and low-viscosity fuels on small power plants on Greenland. The many years of experience have been transferred to the standard marine GenSet. To be prepared for operation on compliant fuels after 2020, the HFO GenSets will be updated with optimised fuel pumps and inlet/exhaust valve materials for low-viscosity fuels.

It is important to note that paraffinic and aromatic fuels are incompatible and should not be mixed in the same fuel tank. Notice the issued Service Letters, PrimeServ Customer Information and follow Everllence guidelines.

Methanol

Everllence is developing methanol technology paths for various engine types. Green methanol is an important fuel option to decarbonise the operation of propulsion and auxiliary GenSet equipment. Ensuring the feasibility of later retrofits can be crucial to avoid the risk of stranded assets by enabling the concurrent adaption of ships to expected regulations and fuel supply.

Products marked with **Methanol ready*** are intended to be available in future to be sold as methanol capable or will be intended to be available for retrofit to methanol operation under specific boundary conditions.

Please contact Everllence for further details on the engines marked as methanol ready, the certifying class societies, and the currently expected availability of methanol ready for the individually marked engines.

The background of the entire advertisement is an underwater scene. It features a large, dark, textured shape that resembles a shark's head and eye, partially obscured by the water and light. The water is a deep blue-green color with visible bubbles and light rays filtering through, creating a sense of depth and movement.

Everllence

Power through uncertainty

**Reliable four-stroke
small-bore engines for
the world's merchant fleet**

Regulatory and fuel-related uncertainty can make it difficult to plan investments in propulsion and GenSets. With our small-bore engines, you are prepared for whatever lies ahead.

Everllence has built its position as the leading designer and developer of small-bore engines for the world's merchant marine fleet on the basis of high reliability and efficiency.

GenSets

GenSets can be applied as auxiliary GenSets, GenSets for electric propulsion or for offshore applications.

Project specific demands can be clarified at an early project stage.

Tier III GenSets

Four-stroke GenSets are Tier III compatible when a downstream SCR is added to clean the exhaust gas on a Tier II engine. The additional SCR will only have an impact on SFOC if the backpressure is increased.

Everllence four-stroke propulsion systems

Alpha propeller and aft ship solutions

Propeller programme – CPP and FPP

Alpha CPP (controllable pitch propeller):

- As standard Mk 5 propeller versions are 4-bladed
 - optional 3- and 5-bladed propellers are available on request
 - optional full-feathering capability for all hub sizes and blade numbers
- Standard power range is up to 40 MW per shaft
- The figures stated after VBS (in the following tables) indicate the propeller hub diameter
- Standard blade/hub materials are Ni-Al-bronze, stainless steel is optional
- The propellers are available up to the highest ice classes, however, the standard programme is based on 'no ice'

The Alpha FPP (fixed pitch propeller) portfolio includes:

- Power range of 4-50 MW per shaft
- Blade configurations for 3-, 4-, 5-, and 6-bladed propellers
- Monoblock propellers or as built-up for special applications
- Propellers with integrated shaftline and stern tube solutions

The following benefits characterise our propeller solutions:

- High-efficient, hydrodynamically optimised blade profiles – Kappel designs available
- High reliability – robust approach with ample mechanical design margins
- High-efficient aft ship integration with rudder, rudder bulb, ducts and other efficiency devices.
- Layouts for complete propulsion and propeller shaft systems
- A wide range of stern tube lube and sealing systems are offered for oil, water and biodegradable oils.
- Plant calculations with upfront consideration of torsional vibrations (TVC), ice impact simulations, whirling, etc.
- Our Alphasonic 3000 Propulsion Control System ensures optimised and safe operation

Alpha propeller and aft ship solutions

Four-stroke propulsion system installation

Complete powertrain with propeller and aft ship equipment.

The hydrodynamic edge

In the complex hydrodynamic entity embracing hull, propeller, and rudder - our CFD-based software masters the holistic approach of customised blade and rudder bulb designs.

We perform 'Resistance calculations' and 'Calculations of wake field', which form the basis for the following:

- Final propeller design
- Self-propulsion calculations
- Cavitation extent calculations
- Propeller-induced pressure impulses and CIS (cavitation inception speed)

Save the 'stock propeller test'; save time and save money.

With EcoBulb rudder bulb and propeller hub fairing cone installed, uniform flow without separation creates improved thrust ahead, and less power is required.

CFD model with streamlines and surface pressure distribution.

Alphatronic 3000 propulsion control system

A high number of various FPP and CPP propulsion package applications are controlled by the Alphatronic 3000 system – customised for combinations of Everllence medium and high speed engines in a wide range of diesel-mechanical, hybrid or electric propulsion setups.

Simple system architecture for a straightforward twin 175D FPP plant

Alphatronic 3000 at your finger tips: Safe and accurate propulsion control all the way – from the navigator's finger tips to the propeller tips. Any manoeuvring order given is translated into electrical speed setting-, pitch- or clutch signals, governing the hydraulic servo circuits of the gearbox and propeller system. Swift and reliable vessel manoeuvres are ensured due to quick and stable system response.

Everllence
turbochargers
and exhaust
gas systems

Performance meets simplicity

Find your perfect fit

Everllence has a long and successful track record in the development of exhaust gas turbochargers for low-, medium- and high-speed combustion and gas engines. Drawing on its unrivalled expertise in the design and manufacture of this crucial engine component, Everllence can offer you world-leading technology that helps you maximise the efficiency of your operations.

Everllence turbochargers are designed to deliver peak performance throughout their working lives – in some of the harshest conditions encountered anywhere in the world. This is achieved by combining three elements: simplicity, flexibility and reliability. For example, we develop and build our turbochargers to make installation, operation, servicing and maintenance as easy and efficient as possible. This reduces your initial capital investment and results in lower lifecycle costs.

Applications

- Marine propulsion
- Marine GenSets
- Power generation
- Construction
- Mining
- Off-road vehicles
- Locomotives
- Industrial
- Offshore
- Mechanical drives

TCP and TCF

Ready for the future

Ready for the future with enhanced performance and efficiency – the TCP and TCF series of radial turbochargers can achieve maximum pressure ratios of up to 7. A benchmark figure that sets new industry standards.

TCP and TCF turbochargers are from our latest generation of radial turbochargers. TCP turbochargers are suitable for high-speed and medium-speed engines, whereas the TCF type turbochargers are suitable for all speed ranges, including low-speed. Both turbocharger types are used in marine, power, locomotive and off-road applications, designed for operation on both future and conventional fuels.

TCP benefits

- Increase in power density of up to 20%
- Decrease of specific engine costs of up to 20%
- Improved efficiency levels of more than 70%
- Significantly improved dynamic behavior: 25% reduction in rotor moment of inertia
- Plug & play (keep the same flange connections as existing turbochargers)

TCF benefits

- 20% increase in specific flow
- Potential use of smaller or fewer turbochargers: cost savings
- Highest efficiencies at part load
- Significant reductions in fuel consumption and emissions
- Significantly improved dynamic behavior: 25% reduction in rotor moment of inertia
- Same standard connection dimensions as previous turbochargers
- Highest efficiencies of more than 70% at part load

Technical data

Turbine type	Radial
Max. permissible temperature	650/750°C
Pressure ratio	up to 6.7

Suitable for future fuels (hydrogen, ammonia and methanol) as well as conventional fuels (HFO, MDO and gas)

Supercharged engine output

Type	kW	Mass kg
TCP12	800	80
TCP14	1,150	120
TCP16	1,600	190
TCP18	2,200	320
TCP19	3,000	520
TCP20	4,200	840
TCP22	5,800	1,300

Technical data

Turbine type	Radial
Max. permissible temperature	650/750°C
Pressure ratio	up to 5.4

Suitable for future fuels (hydrogen, ammonia and methanol) as well as conventional fuels (HFO, MDO and gas)

Supercharged engine output

Type	kW	Mass kg
TCF12	1,000	70
TCF14	1,450	120
TCF16	2,000	190
TCF18	2,700	320
TCF19	3,800	520
TCF20	5,200	830
TCF22	7,200	1,400

TCT

High-performance solution

The new TCT design is optimised for IMO Tier III requirements, and suitable for both conventional and dual-fuelled, two- and four- stroke engines in marine and power applications.

The latest Everllence axial turbocharger generation offers significant down-sizing to meet current market requirements. It offers a smaller, lighter design with a superior charging efficiency, and a high charging pressure compared to its predecessor and other similar turbochargers available on the market.

TCT features

- Long time between overhauls (TBOs)
- Maintenance friendly service concept
- Highest efficiency levels
- Compact and light design
- High-performance plain bearings

Technical data

Turbine type	Axial flow turbine
Max. permissible temperature	520°C
Pressure ratio	up to 4.7
Optimised for IMO Tier III	

Supercharged engine output

Type	kW	Mass kg
TCT30	7,500	1,820
TCT40	9,460	2,500
TCT50	12,000	3,455
TCT60	15,120	4,735
TCT70	19,040	6,480
TCT80	24,030	8,890

Specific air consumption (le) 7.5 kg/kWh

Market leader in two-stage turbocharging

Outstanding turbocharging efficiency

ECOCHARGE two-stage turbocharging is suitable for high- and medium-speed engines of all fuel types and for application in all engine power ranges. Extremely high efficiencies and pressure ratios enable increased power density and improved key engine parameters. For example, it is possible to use a smaller engine for the same required power output or to achieve lower NO_x emissions and lower specific fuel oil consumption (SFOC).

As a compact two-stage unit, the ECOCHARGE delivers outstanding turbocharging efficiency. A variety of product types and sizes are available, ensuring the perfect turbocharger-to-engine-fit. ECOCHARGE always consists of a clever combination of high- and low-pressure turbochargers.

While TCX has been specifically designed for high-pressure applications, TCA and TCR as well as our new TCT and TCF generation series round up the package as low-pressure turbochargers.

Technical data

Turbine type	Mixed flow turbine
Max. permissible temperature	650°C
Pressure ratio (two stages)	up to 10.5
Suitable for HFO, MDO, gas	

TCX turbocharger programme

Type	Max. engine output*	Mass
	kW	kg
TCX17	8,500	517
TCX19	11,900	870
TCX21	16,600	1,564
TCX23	23,300	2,394

EGR blower series

Electrical Turbo Blower (ETB)

Specifically designed for EGR systems, the ETB plays an important role in enabling these systems to reach the IMO Tier III emission limitation. The EGR blower is a core component of Everllence's high-pressure EGR system that raises the exhaust gas pressure to overcome the pressure difference between exhaust gas and scavenge air receivers. In addition, the recirculated exhaust gas amount is controlled during the EGR operation by varying the blower speed.

The desired EGR operating conditions are achieved by using a high-speed electric motor, directly coupled to the compressor wheel and speed controlled by a frequency converter. The scope of supply consists of the ETB and one cabinet with frequency converter and sine wave filter.

The ETB features a high-efficient blower wheel, optimized for the low-pressure ratios necessary for the high-pressure EGR system of a two-stroke combustion engine with materials designed to withstand corrosive agents caused by the sulphur content of fuels. As such, the ETB is suitable for high-pressure EGR engines of all fuel types and in all application ranges.

Technical data

Type	Max. blower speed	Mass of blower
	rpm	kg
ETB40	9,170	1,860

The maximum engine power output with one ETB depends on the EGR volume flow and the pressure difference between exhaust gas and scavenge air receivers. Therefore, an EGR blower selection tool will be introduced and the output will be available in CEAS soon.

For more information and blower assignment, please contact turbochargers@everllence.com.

ETB – explicitly designed for EcoEGR

ETB is explicitly designed for EcoEGR applications where the blower will run continuously in both Tier III and Tier II Eco mode. This results in a significant SFOC reduction when the engine is operated in Tier II mode.

In the SFOC-optimised Tier II Eco mode, the EGR volume flow is approx. 50% of the required volume flow in Tier III mode. To cover the operating points of both running modes, the ETB features an extremely wide compressor map.

The ETB achieves benchmark efficiencies and, therefore, minimises operational costs.

For more information about EcoEGR, see the section EcoEGR in the chapter describing Everllence B&W two-stroke propulsion engines.

SCR

Selective Catalytic Reduction (SCR) is a method to reduce nitrogen oxides (NO_x) in the exhaust gas flow of engines to meet the required Tier III limits. SCR is the most common and approved system for achieving NO_x reduction rates of up to 90%, suitable for power plants and marine applications.

Everlence has experience with both development and service of SCR systems. In 2017, the first SCR systems were introduced. There are two types of SCR layouts available:

- Low-pressure SCR-LP (after turbocharger)
- High-pressure SCR-HP (before turbocharger)

SCR-LP and HP systems

Everllence is the first manufacturer to successfully produce and offer IMO Tier III compliant four-stroke marine engines based on a fully modular SCR kit covering our entire four-stroke engine portfolio. In 2014, Everllence was awarded the first IMO Tier III EIAPP certificate together with the classification society DNV-GL.

The Everllence standard SCR system is available in fourteen different sizes covering our entire portfolio of four-stroke engines. Customised SCR systems are offered on demand.

Everllence has developed a complete range of SCR systems that work perfectly with our engines for maximum system efficiency. The intelligent exhaust gas temperature control allows significant savings in fuel consumption compared to third-party supplier systems. SCR systems work with MGO, MDO and HFO with up to 3.5% sulphur.

Our modular system comes in 14 different sizes to match all power demands. Some notable benefits of standardisation are significant cost reduction and simplification of installation.

Urea consumption

The urea consumption depends on engine type and selected performance characteristics (engine map). For an engine with ECOMAP capability it depends on operating profile, fuel type, ambient conditions, type of reduction agent, etc.

For more detailed information on the expected level of urea consumption, please contact Everllence with your project specific request.

The modular SCR component kit

SCR-HP

The SCR-HP is a small and compact NO_x emission reduction system. The most compact design in the market allows for easy integration, and the few frame sizes will cover the entire two-stroke portfolio up to 25 MW per SCR reactor.

The integrated mixing unit reduces the overall length and volume. The specific honeycombs ensure a compact design.

The SCR-HP can be mounted in all positions and is capable of running on all fuels.

Auxiliary components like the urea injection lance, urea dosing unit and urea pump module are from Everllence's well-proven SCR-LP system.

SCR-HP system

Dimensions

Cluster	Reactor diameter	Reactor length ±0.1% sulphur	Reactor length ±3.5% sulphur
	mm	mm	mm
1	2,000	4,800	5,800
2	2,400	5,000	6,000
3	2,900	5,500	6,500
4	3,400	5,900	6,900
5	3,900	6,300	7,300
6	4,500	6,900	7,900

Illustration contains optional features

Flexible turbocharging

VTA

VTA (variable turbine area) allows charge air delivery to be precisely, steplessly and continuously optimised to the demand for charge air at all engine loads and speeds. VTA minimises fuel consumption and related exhaust emissions.

Flexible air and fuel management is key to meeting the emissions legislation of the future while increasing engine performance and reducing specific fuel oil consumption (SFOC). In heavy fuel oil applications, VTA technology has a powerful and positive role to play.

Benefits

- Reduced consumption: up to 5 g/kWh lower fuel consumption
- Reduced emissions: lower soot and smoke emission and lower particle emissions
- Easy application: suitable for TCA and TCR turbochargers and retrofit packages

Everllence

Everllence
PrimeServ

With 100+ locations worldwide, we deliver OEM expertise, fast response, and full lifecycle support – keeping your fleet moving safely, efficiently, and without interruption.

We know how critical uptime is to you and your engines. That's why we combine rapid service with deep engine knowledge to protect your uptime and performance, 24/7, own and third-party engines.

Wherever you sail, whatever you power, whatever you process, **we're there to provide peace of mind**

More than support. A true service partner.

- Global service network with 24/7 access
- High-quality OEM spare parts for even non-Everlence products
- Tailored service agreements to fit your operations
- Digital diagnostics and remote monitoring
- On-site, remote, and academy training for your crew
- Retrofit and upgrade solutions for compliance and fuel efficiency

From MAN to Everlence – a legacy of excellence

Everlence PrimeServ carries forward the full strength of MAN PrimeServ – delivering the expert service you've always trusted for both our own and third-party engines.

Same people, same precision, same global reach.

Everllence

PrimeServ LTSA

Enjoy the confidence of expert support

Long Term Service Agreements

Everllence PrimeServ Long Term Service Agreements (LTSA) provide your fleet with financial and operational security – and bring you peace of mind, knowing we'll always be there when you need us. We tailor our services to fit your strategy and customize our maintenance plans to meet your long-term goals. You benefit from access to a single point of contact for efficient communication, fast support, and continuous engine optimization via online monitoring.

Whether the need is as simple as the prompt supply of genuine parts, or as comprehensive as complete maintenance management for a vessel or fleet, the LTSA has an array of customizable solutions to meet every customer or application requirement. Our flat-fee arrangements and tailored solutions help you plan costs. Efficient supply chain planning ensures timely availability of spare parts while our global PrimeServ presence means you can depend on reliable support anywhere in the world.

Experience smooth and efficient operations with our comprehensive LTSA solutions.

Lifecycle upgrade

Everllence PrimeServ is now offering its customers the opportunity to retrofit 48/60A and 48/60B engines to state-of-the-art 51/60 types.

The upgrade enables customers to prepare older engines already in service for future, climate-neutral operations.

Upgraded engines will effectively be equivalent technically to newly built 51/60 units and, as a result, achieve significant savings in fuel consumption, CO₂ and pollutant emissions, and increase reliability.

As a further option, newly converted engines can be upgraded for operation on synthetic fuels for a low premium.

L51/60R

Retrofit Variant for 48/60A and 48/60B*

Tier II

Bore: 510 mm, Stroke: 600 mm

Dual-fuel conversion

Decarbonization, greater efficiency, and alternative e-fuels are just some of the benefits our advanced retrofit solutions provide. Whether you operate tankers, container vessels, or offshore units, a dual-fuel conversion of your ship can significantly reduce emissions and fuel costs. Everllence PrimeServ continuously develops and delivers retrofit products and solutions, enabling the existing fleet to meet current and future environmental regulations.

Using alternative fuels, such as SNG, LNG, ethane, LPG, or methanol, greatly reduces SO_x, NO_x, CO₂, and particulate matter, enabling you to comply with global environmental regulations, secure worldwide port access, and meet your own sustainability targets.

Our dual-fuel retrofit solutions are not limited to the main engine, and customized projects can be provided as a turnkey solution or include gas systems in partnership with Cryo. To ensure the process is executed seamlessly from start to finish, Everllence PrimeServ covers everything from research and site survey to engineering and project management, and finally to hardware commissioning.

Everllence PrimeServ Academies

Professional certification

Everllence PrimeServ Academies offer courses covering the entire portfolio of Everllence products, both two- and four-stroke, power generation, and turbochargers. In the academies, participants are guided through theoretical lectures, and hands-on exercises covering the operation, maintenance, and troubleshooting, of the Everllence product portfolio. We strive to create a “real life” atmosphere such that participants can relate learning objectives to their daily working environment. That includes working on original engines, fully functioning diesel GenSets, and simulators.

In addition to our on-site courses, we now offer new digital training methods and solutions. From self-paced eLearning courses to instructor-led online courses and blended learning courses, you get maximum flexibility in choosing a course format that perfectly fits your needs.

Please find out more about the Everllence PrimeServ Academies:
www.everllence.com › [Services](#) › [Everllence PrimeServ Academy](#) › [Training](#).

PrimeServ Assist

Secured availability – optimised efficiency

Be one step ahead by using Everlence PrimeServ Assist. A proactive service solution from Everlence.

Get an instant, accurate snapshot of your machinery's status with all relevant data consolidated on one interface. PrimeServ Assist makes sure your operators are always on top of efficiency data. The result: accelerated decision-making as well as improved efficiency and cost-effectiveness. For an even better fleet oversight, PrimeServ Assist provides precise and far-reaching efficiency insights about how the individual units perform. All digital and absolutely accurate, PrimeServ Assist offers the ideal groundwork for informed decisions and the right adjustments.

Get advice on how to keep your machinery operating at peak efficiency for longer. Our experts are here for you 24/7, continuously monitoring and analyzing live data from machinery in the field, diagnosing anomalies and notifying you with valuable operational and maintenance advice.

To provide you with comprehensive insights, a monthly summary is automatically generated and available on Everlence CEON.

The earlier you spot a deviation, the sooner you can act. That's the philosophy behind PrimeServ Assist. And it's made possible by Everlence CEON.

The digital backbone of PrimeServ Assist

Everlence CEON is at the core of our digital ecosystem. This cloud-based platform connects all Everlence machinery to a powerful analytics infrastructure. It monitors thousands of installations in real time, delivering insights that drive smarter, faster decisions across fleets. Seamlessly integrated with all our digital solutions, CEON enables predictive service, peak efficiency, and real progress toward decarbonization.

Everllence Data+

Data solutions for the shipping industry

A fleet of marine engines generates an overwhelming amount of data. Everllence Data+ enables you to find the value in this sea of data - helping you to manage your ships and cargo more efficiently, ensuring vessel availability, and reducing emissions and costs. Thanks to our deep domain knowledge of the engines, we can ensure your equipment data is available, scalable and most importantly, actionable.

Based on Everllence CEON, the cloud-based platform behind our digital portfolio, Everllence Data+ securely and intelligently collects and integrates engine data in a consumable and comprehensive way. It is available for both new builds and as a retrofit on Everllence two-stroke engines.

Everllence Asset+

Secured availability – optimised efficiency

Everllence Asset+ is a range of solutions that gives you the opportunity to add functionalities to your vessels' engine systems. In other words, it makes your equipment better at performing specific tasks. Everllence Asset+ solutions raise ship performance, keep your equipment up to date, and help you comply with environmental regulations, advancing your operations on the road to energy transition and decarbonization.

Everllence Asset+ provides the possibility to select the functionality or service needed for a specific engine and, hence, adds value to the particular vessel and its purpose/task. In addition, Everllence Asset+ will offer connectivity and regular security and software updates, thus offering an engine that can be maintained as state-of-the-art across the entire life cycle.

MFM for lube oil

Multi Fluid Monitor is a multibrand solution

Step into a new dimension of operation & maintenance with continuous condition monitoring

It all starts with a tiny anomaly, and sooner or later, it will have consequences: performance degradation, safety hazards or even failure and downtime.

What if you could receive an alarm to stop your engine in real time?
What if you then get the recommendation to troubleshoot in time to prevent serious damage?

How do you detect tiny anomalies between planned visits, like a bearing seizure, cylinder scuffing, slight wear of components, water presence, fuel pollution, soot pollution, etc.? Now you can. Now there's Everllence MFM for lube oil.

Everllence Multi Fluid Monitor for lube oil meets CE standards, has awarded certifications: Marine BV, ABS

- Navy: NN06630145997886, IEC shocks standards
- Cyber Security: BV IACS UR E27.

Everllence Omnicare

**Your one-stop service solution,
regardless of manufacturer**

For over a century, Everllence PrimeServ has been providing the best service solutions and technical support for all Everllence engines and equipment.

Now, it offers maintenance, repair, and spare parts supply for engines, turbochargers, and auxiliary equipment from non- Everllence manufacturers too under PrimeServ Omnicare. You benefit from a single point of contact for your third-party equipment, reduced complexity and cost of servicing your fleet, as well as OEM supply chain.

Everllence PrimeServ is authorized by several OEMs to ensure the highest standards of competency and workmanship for your third-party equipment.

Our PrimeServ Omnicare service scope currently covers MET turbochargers, CENTA flexible couplings, and C.C. Jensen lube oil filtration systems, bringing simplicity, cost-efficiency, and improved environmental performance to your fleet management.
